Group Theory

Example. Dihedral Group

Ring Theory

3.1 Ring of Fractions

Theorem 1. Let R be a Commutative Ring, $D \subset R$ be a subset such that $\begin{cases} \text{no zero, no zero divisors} \\ \text{closed under multiplication} \end{cases}$ Then, there exists a Commutative Ring Q with identity satisfies:

- 1. R can embed in Q, and every element of D becomes unit in Q. More precisely, $Q = \{rd^{-1} \mid r \in R, d \in D\}$.
- 2. Q is the smallest Ring with identity such that every element of D becomes unit in Q.

Proof. Let $\mathcal{F} \stackrel{\mathsf{def}}{=} \{(r,d) \mid r \in R, \ d \in D\}$ and the relation \sim on \mathcal{F} by $(r_1,d_1) \sim (r_2,d_2) \iff r_1d_2 = r_2d_1$. Then, \sim is equivalent relation: reflexive and symmetric are clear, and Suppose that $(r_1,d_1) \sim (r_2,d_2)$ and $(r_2,d_2) \sim (r_3,d_3)$.

$$r_2d_3 = r_3d_2 \implies r_2d_1d_3 = r_3d_1d_2 \implies r_1d_2d_3 = r_3d_1d_2 \implies d_2(r_1d_3 - r_3d_1) \implies r_1d_3 = r_3d_1$$

Thus transitivity shown. Define

$$\frac{r}{d} \stackrel{\mathrm{def}}{=} [(r,d)] = \{(a,b) \mid (a,b) \sim (r,d)\}, \quad Q \stackrel{\mathrm{def}}{=} \left\{\frac{r}{d} \;\middle|\; r \in R, \;\; d \in D\right\}$$

And define operations $+, \times$ on Q:

$$\frac{r_1}{d_1} + \frac{r_2}{d_2} \stackrel{\text{def}}{=} \frac{r_1 d_2 + r_2 d_1}{d_1 d_2}, \quad \frac{r_1}{d_1} \times \frac{r_2}{d_2} \stackrel{\text{def}}{=} \frac{r_1 r_2}{d_1 d_2}$$

Well-Definedness: If $rac{r_1}{d_1}=rac{r_1'}{d_1'}$ and $rac{r_2}{d_2}=rac{r_2'}{d_2'}$,

$$\frac{r_1d_2+r_2d_1}{d_1d_2} = \frac{r_1d_2d_1'd_2'+r_2d_1d_1'd_2'}{d_1d_2d_1'd_2'} = \frac{(r_1d_1')d_2d_2'+(r_2d_2')d_1d_1'}{d_1d_2d_1'd_2'} = \frac{(r_1'd_1)d_2d_2'+(r_2'd_2)d_1d_1'}{d_1d_2d_1'd_2'} = \frac{(r_1'd_1)d_2d_2'+(r_2'd_2)d_1d_1'}{d_1d_2d_1'd_2'} = \frac{(r_1'd_1')d_2d_2'+(r_2'd_2')d_1d_1'}{d_1d_2d_1'd_2'} = \frac{(r_1'd_1)d_2d_2'+(r_2'd_2')d_1d_1'}{d_1d_2d_1'd_2'} = \frac{(r_1'd_1')d_2d_2'+(r_2'd_2')d_1d_1'}{d_1d_2d_1'd_2'} = \frac{(r_1'd_1')d_2d_2'+(r_2'd_2')d_1d_1'}{d_1'd_2'} = \frac{(r_1'd_1')d_2d_1'+(r_2'd_1')d_1'}{d_1'd_2'} = \frac{(r_1'd_1')d_2d_1'+(r_2'd_1')d_1'}{d_1'd_2'} = \frac{(r_1'd_1')d_1'+(r_2'd_1')d_1'}{d_1'd_2'} = \frac{(r_1'd_1')d_1'+(r_2'd_1')d_1'}{d_1'd_2'} = \frac{(r_1'd_1')d_1'+(r_2'd_1')d_1'}{d_1'd_1'} = \frac{(r_1'd_1')d_1'+(r_1'd_1')d_1'}{d_1'd_1'} = \frac{(r_1'd_1')d_1'+(r_1'd_1')d_1'}{d_1'd_1'} = \frac{(r_1'd_1')d_1'+(r_1'd_1')d_1'}{d_1'd_1'} = \frac{(r_1'd_1')d_1'+(r_1'd_1')d_1'}{d_1'd_1'} = \frac{(r_1'd_1')d_1'+(r_1'd_1')d_1'}{d_1'd_1'} = \frac{(r_1'd_1')d_1'+(r_1'd_1')d_1'}{d_1'd_1'} = \frac{(r_$$

$$\frac{r_1r_2}{d_1d_2} = \frac{r_1r_2d_1'd_2'}{d_1d_2d_1'd_2'} = \frac{(r_1d_1')(r_2d_2')}{d_1d_2d_1'd_2'} = \frac{(r_1'd_1)(r_2'd_2)}{d_1d_2d_1'd_2'} = \frac{r_1'r_2'd_1d_2}{d_1d_2d_1'd_2'} = \frac{r_1'r_2'}{d_1d_2}$$

Now, (Q,+, imes) constructs Commutative Ring with identity: for any $d\in D$, put $0_Q\stackrel{\mathsf{def}}{=} \frac{0}{d},\ 1_Q\stackrel{\mathsf{def}}{=} \frac{d}{d}.$ Then,

- 1. $(R,+,\times)$ closed under the operations since D is closed under the multiplication.
- $\textbf{2.} \ \, (R,+) \ \, \textbf{has a zero:} \ \, \frac{r_1}{d_1} + 0_Q = \frac{r_1}{d_1} + \frac{0}{d} = \frac{r_1d + 0d_1}{d_1d} = \frac{r_1d}{d_1d} = \frac{r_1}{d_1}.$
- $\textbf{3.} \ \ (R,+) \ \ \textbf{has an inverse:} \ \ \frac{r_1}{d_1} + \frac{-r_1}{d_1} = \frac{r_1d_1 + (-r_1)d_1}{d_1d_1} = \frac{[(r_1) + (-r_1)]d_1}{d_1d_1} = \frac{0d_1}{d_1d_1} = \frac{0}{d_1d_1} = 0_Q \, .$
- **4.** $(R,+,\times)$ satisfies distributive law:
 - 4-1. The left law:

$$\begin{split} \frac{r_1}{d_1} \times \left(\frac{r_2}{d_2} + \frac{r_3}{d_3}\right) = & \frac{r_1}{d_1} \times \frac{r_2d_3 + r_3d_2}{d_2d_3} = \frac{r_1r_2d_3 + r_1r_3d_2}{d_1d_2d_3} = \frac{r_1r_2d_1d_3 + r_1r_3d_1d_2}{d_1d_2d_1d_3} = \frac{r_1r_2}{d_1d_2} + \frac{r_2r_3}{d_2d_3} \\ = & \frac{r_1}{d_1} \times \frac{r_2}{d_2} + \frac{r_2}{d_2} \times \frac{r_3}{d_3} \end{split}$$

4-2. The right law:

- 5. (R,\times) has an identity: $\frac{r_1}{d_1}\times 1_Q=\frac{r_1}{d_1}\times \frac{d}{d}=\frac{r_1d}{d_1d}=\frac{r_1}{d_1}$.
- 6. Elements of D become unit in Q: Define $\iota:R\to Q:r\mapsto \frac{rd}{d}$ where $d\in D$ is any fixed element in D. Then, ι is Ring-Monomorphsim because:
 - 6-1. Well-Defined and Injective: $\iota(r_1)=\iota(r_2)\iff \frac{r_1d}{d}=\frac{r_2d}{d}\iff (r_1-r_2)dd=0\iff r_1=r_2$
